SOUTH BARROW WELL NO. 20

INTRODUCTION

South Barrow Well No. 20 is located in the East Barrow Gas Field (Figure 1). The designation "East Barrow Gas Field" is now applied to those wells which were earlier identified as "South Barrow Gas Field, East Area". The South Barrow Gas Field and the East Barrow Gas Field are now recognized as two separate fields. The well is located approximately 10 miles southeast of the village of Barrow, and is 1,600 feet from the east line and 1,980 feet from the north line of protracted Section 26, Township 22 North, Range 17 West, Umiat Meridian; Latitude: 71°13'57.02"N; Longitude: 156°20'11.98"W. Alaska State Plane Coordinates are: Y = 6,303,300.91 and X = 696,001.93, Zone 6. The elevations are 30' kelly bushing, 12' pad, and 7' ground.

Rig-up started on April 4, 1980, and the well was spudded on April 7, 1980. The hole was drilled to a total depth of 2,356 feet. The primary objective of the well was the Jurassic, Lower Barrow sandstone, encountered between 2062' and 2082'. The secondary objectives of the well were the Upper Barrow sandstone at 1980' to 2043' and the Sag River Sandstone at 2240' to 2314'. A third objective of the well was sandstones in the "Pebble Shale". At the conclusion of the drilling and evaluation, the well was plugged back and completed in two sandstones of the "Pebble Shale" as a shut-in "marginal" oil well, and the rig was released on May 10, 1980.

Husky Oil NPR Operations, Inc., supervised and directed the drilling and support operations as prime contractor for the USGS, ONPRA. U. S. Department of the Interior. Brinkerhoff Signal, Inc. was the drilling contractor; Brinkerhoff Rig 31, a National T-20, was used to drill the well.

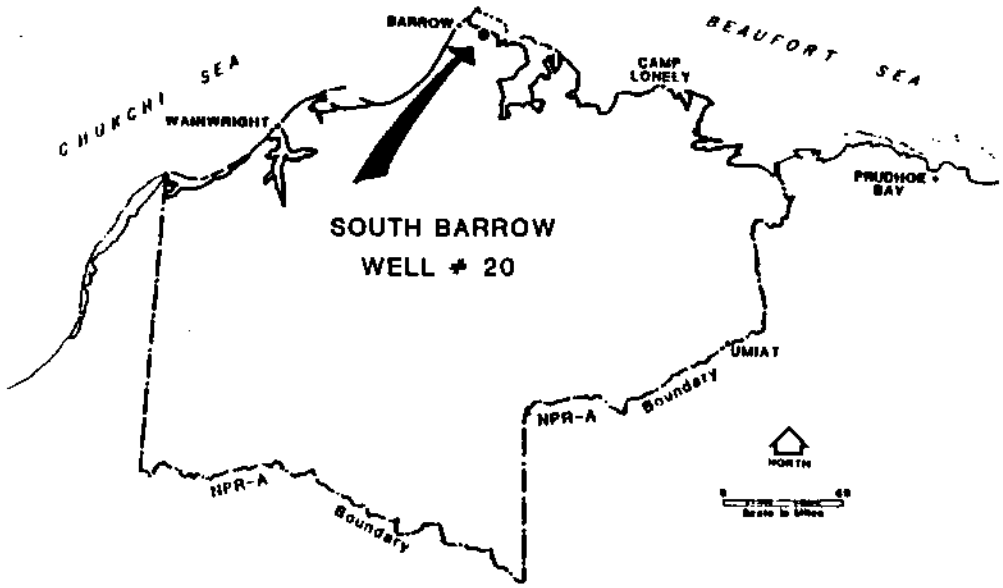

FIGURE 1- WELL LOCATION MAP - SOUTH BARROW NO. 20

DRILLING SUMMARY

Rig-up operations started on April 4, 1980, and 13-3/8" conductor pipe was set at 100' and cemented with 230 sacks of Class "G" cement. The well was spudded April 7, 1980, at 6:00 a.m. A 12-1/4" hole was drilled to 1500'; the hole was then surveyed, and logged with DIL/SFL/GR/SP and BHC-Sonic/GR/TTI. Thirty-five joints of 9-5/8", 53.5#, S-95 Buttress casing were run to 1490' and cemented with 1,300 sacks of permafrost cement mixed at 14.9 ppg. A float collar and nine centralizers were run on the casing. A $CaCl_2$ mud system was built while waiting on cement, and for the blowout-preventer stack to be nippled up. The purpose in converting to a calcium-chloride based mud system was to inhibit the fresh water induced "swelling" of montmorillonitic clays, which had been proved to exist in the Barrow sandstones and in the Sag River Sandstone from water susceptibility tests that had been conducted on core samples taken from South Barrow Nos. 12 and 13. The blowout-preventer stack and the wellhead were tested. The Hydril element had to be replaced. After installing the wear bushing, the hole was reamed from 40' to 550' to remove frozen drilling mud. The casing was tested to 1,500 psi. The float collar, shoe, and ten feet of formation were drilled to 1510'. The formation was then tested to 0.61 psi/ft. equivalent gradient.

An 8-1/2" hole was drilled to 2140', and conditioned for logs. Logs were run as follows: DLL/GR/SP/MSFL; BHC-Sonic/GR/TTI; FDC/CNL/GR/CAL. Fifty-five joints of 7", 38#, S-95 Buttress casing were run after the hole had been conditioned and the drill collars laid down. The casing shoe was landed at 2127', with the float collar at 2090' and FOs at 1297' and 1217'. Circulation was lost prior to cementing the casing. The casing was cemented with 80 sacks of Class "G" cement containing 2% $CaCl_2$ and 2% CFR-2 mixed at a slurry weight of 15.8 ppg, with very slight returns. The lower FO at 1297' was opened, a RTTS packer set, and the 7" x 9-5/8" annulus circulated. The FO was closed, the blowout preventer nippled down, and the casing landed. The packoff and tubing head were installed and tested to 3,000 psi. The blowout preventer was nippled up, tested and the wear bushing installed. Both FO's were opened, circulated, closed and tested to 2,000 psi.

Preparations were made to Arctic Pack the 7" x 9-5/8" annulus. The lower FO was reopened, an injection rate of 3.4 BPM at 350 psi established, and 60 sacks of 15.0 ppg Permafrost cement down-squeezed through it. The cement was displaced with a barrel of water and 6.5 barrels of mud. The packer was released and the FO closed and tested to 2,000 psi. The original mix of Arctic Pack was found to be contaminated with 36% water, and it was remixed. The 7" x 9-5/8" annulus was then displaced with Arctic Pack through the FO at 1217' to the surface. The FO was closed and tested to 2,000 psi.

Drilling ahead continued. The shoe was drilled out to 2150' and the formation tested to a 0.61 equivalent gradient with no leak off. The 5-5/8" hole was drilled to 2356' with the following cores cut: Core No. 1, 2247' to 2269', 20.2' recovered; Core No. 2, 2269' to 2299', 29' recovered;

Core No. 3, 2299' to 2314', 14.9' recovered. Ran in hole for Drill-Stem Test No. 1. Open hole Drill-Stem Test No. 1 was conducted on the way down in the interval 2127' to 2314' with no water cushion. Results were as follows:

> 1st FP (120 minutes): IHP 1,163 psi, opened tool with strong blow, decreased to weak blow in 20 minutes through 1" surface choke, GTS in 60 minutes. IFP 181 psi, shut in for 240 minutes, ISIP 909 psi. (gauge No. 134 @ 2139'; field report).
>
> 2nd FP (480 minutes): Opened with strong blow, stabilized flow rate through 1/8" choke of 12 MCFPD with 17 psi SFP, FFP 206-289 psi, shut in for 900 minutes, FSIP 958 psi, FHP 1,163 psi (gauge No. 134 @ 2139'; field report). Recovered 2.6 barrels of slightly gas-cut mud with trace of oil.

Resumed drilling to 2356' (total depth). Schlumberger logs were run at total depth as follows: DII/GR/SP; FDC/CNL/GR/CAL; BHC-Sonic/GR; MLL/GR. A CBL/VD/CCL log was also run. It showed cement only as high as the top of the Lower Barrow sandstone suggesting possible breakdown of the reservoir during the initial cementing of the 7" casing.

After logging, a decision was made to plug back and production test the Barrow sandstones. Plug No. 1, 50 sacks of 15.8 ppg Class "G" cement was spotted from 2343' to 2025' in the 7" casing. Ran in hole and tagged cement plug at 2080', cleaned out to 2100', and made preparations to recement across the sands behind the 7" casing to insure isolation of the test zones. An E-Z drill retainer was set at 2095', the casing tested to 2,000 psi, and four perforations shot at 1950'. A second E-Z drill retainer was set at 1930' and tested to 2,000 psi. An injection rate of 3 BPM at 1,000 psi was established, and 10 barrels of water followed by 35 sacks of 15.8 ppg Class "G" cement were pumped. An additional 25 sacks of cement were mixed and displaced at 1-1/2 BPM at 500 psi.

Procedures for Production Test No. 1 of the Barrow sandstones were started. The lubricator was rigged up and tested to 500 psi. The sands were perforated at four shots per foot from 1994' to 2046' and 2064' to 2082'. Two and seven-eights inch tubing was run and landed at 2083' (69 joints, N-80, 6.5#). Ten centralizers were spaced out on the tubing and 1/4" alcohol injection lines run in on it at depths of 1200' and 1900'. The blowout-preventer was nippled down, the test tree nippled up and tested, and the mud displaced with 9.2 ppg $CaCl_2$ water. Initial attempts to rock the well in with nitrogen failed. The well broke down with 400 to 600 psi and $CaCl_2$ water. Further attempts to bring the well in were unsuccessful, and the test was aborted.

The intervals 1994-2046' and 2064-2082' were reperforated at 1994-2046' and 2064-2079', and retested (Production Test No. 2). Seven barrels of Halliburton MCA was poured down the tubing, displaced with $CaCl_2$ water,

and squeezed into the test zones. Gas from Barrow Well No. 19 was used to clean up Barrow Well No. 20, and the test was conducted. Flow through a 1-1/2" choke was 1.31 MMCFGPD, with a maximum flowing wellhead tubing pressure of 30 psi. Bottom-hole temperature and pressure were recorded with a Hewlett-Packard recorder as follows: initial bottom-hole temperature 34.7°F; final bottom-hole temperature 37.2°F; maximum bottom pressure 786 psi.

The well was killed and the Lower Barrow sandstone was squeezed with 48 barrels of Halliburton FEA acid, in an attempt to improve production. The acid was injected at a rate of 1/3 barrels per minute at 350 psi to two barrels per minute at 450 psi. Isolation was lost between the Upper and Lower Barrow sandstones during the acid squeeze, and it appeared that the acid was not squeezed into the desired zones.

The well was again blown clean with gas from Barrow Well No. 19 and flowed. Maximum rate was 1.3 MMCFGPD with approximately 1 barrel of water per minute at a flowing wellhead tubing pressure of 30 psi. After two hours of flow, the well was shut in, and a 4-point flow test conducted. Results are summarized as follows:

Choke	Final Flowing Surface Annulus Pressure	Final Flowing Surface Tubing Pressure	Final Flowing Pressure Through Flow Prover	Rate
1/16	600 psi	500 psi	480 psi	40 MCFPD
3/32	580 psi	450 psi	450 psi	100 MCFPD
1/8	550 psi	365 psi	355 psi	100 MCFPD
3/16	545 psi	330 psi	290 psi	Water to Surface

The well was shut in, and a maximum bottom-hole pressure of 786 psi was recorded with a Hewlett-Packard downhole recorder.

After reviewing test results, it was decided to plug back across the Barrow sandstones and test the higher "Pebble Shale" sands. It must be noted that results from Production Test No. 2 suggests that irreversible formation damage occurred to the Lower Barrow sandstone during the initial cementing of the 7" casing. Wireline log analysis indicates that much better production rates should have been obtained from these sandstones.

Preparations were made to plug-back to the "Pebble Shale" sandstones and isolate the two zones. A retainer was set at 1904', and the perforations in the Barrow sandstones were squeezed with 100 sacks of 15.8 ppg Class "G" cement. Four perforations were shot at 1780', a retainer set at 1749', and 20 sacks of 14.8 ppg Permafrost cement squeezed away.

The "Pebble Shale" sand zones from 1629' to 1639', and from 1556' to 1574' were perforated at four shots per foot for Production Test No. 3. Two and seven-eights inch tubing was run and landed at 1644'. The test is summarized as follows:

Hole full of $CaCl_2$ water. Opened well with no flow, unloaded well with gas from Barrow No. 19, maximum FWHP 170 psi declining to 0 psi at end of test, FSIBHP 193 psi, swabbed total recovery of approximately 21 barrels of gas-cut oil and mud. An engineering production report speculated that a maximum producing rate, by pumping, of 20 BOPD, maybe 25 BOPD, might be attained.

At the conclusion of the test, the well was shut-in, and officially designated an "oil well", although the small amount of oil recovered, the high viscosity of the oil at the low formation temperature (approximately 40° as reported on production engineering report "Pebble Shale Sands Well Test"), and the effect the high viscosity flow would have in reducing the formation pressure away from the wellbore, casts considerable doubt on the validity of the designation of "oil well". The rig was released May 10, 1980 at 6:00 a.m. and then moved to the South Barrow No. 15 location.

U.S. GEOLOGICAL SURVEY
ANCHORAGE, ALASKA

(NOTE: Report results of multiple completion or zone change on Form 9–330.)

17. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)*

This is a confirming notice to plug back South Barrow Well No. 20. This well was drilled to a total depth of 2356', logged, and tested. As a result of the evaluation, plans were developed to plug back the well to evaluate and complete the Barrow Sands. The plug back procedure is attached.

This plan has been discussed with and verbally approved by Mr. Weber on 4/23/80.

SOUTH BARROW WELL NO. 20
PLUG-BACK CEMENTING PROCEDURE

1. Trip in with open-ended drill pipe to TD (2356'). Spot a 50-sack plug. (This is a 216' plug in open hole and 102' inside 7" casing.) Pump ± 10-bbl water spacers ahead and 3 bbl behind the slurry. Adjust spacers to balance the plug. Slurry weight to be 15.8 ppg. Add 2% calcium chloride to the Class "G" cement. The thickening time is ± four hours.

2. Pick up slowly out of the slurry plug. Pull up into the casing and reverse out DP. Trip out.

3. Pick up 5 5/8" bit and 4 3/4" drill collars. Trip in to three stands above the 7" casing shoe. Circulate and WOC 12 hours.

4. Trip in and tag cement plug. Polish plug as required to allow 10-15' of open hole below the bottom perf interval (± 2100').

5. Run cement retainer on drill pipe. Set retainer at 2090' ± 10' below the base of the Barrow Sand. Do not set retainer in a casing collar. Test casing to 1500 psi.

6. Proceed with completion of Barrow Sands.

(other) Oil Well Completion Report			

(NOTE: Report results of multiple completion or zone change on Form 9–330.)

17. DESCRIBE PROPOSED OR COMPLETED OPERATIONS (Clearly state all pertinent details, and give pertinent dates, including estimated date of starting any proposed work. If well is directionally drilled, give subsurface locations and measured and true vertical depths for all markers and zones pertinent to this work.)*

The final procedure describes the completion of South Barrow Well No. 20 as an oil well. Zones 1556'-1574' and 1629'-1639' were tested and found to produce hydrocarbons.

1. After pulling drill pipe, RIH with 55 joints of 2 7/8" tubing and landed at 1644.7' (with 4' mule shoe included).
2. Ten centralizers were run on tubing at 1640', 1609', 1580', 1551', 1520', 1429', 1128', 830', 525', and 226'.
3. All connections were broken, cleaned, redoped, and retorqued when running. Make-up torque was 2300 ft-lbs.
4. Rig down BOPE and nipple up Xmas tree. Test Xmas tree to 3000 psi.
5. Run BPV; secure wellhead.

* Engineering report, "South Barrow No. 20, Pebble Shale Sands Well Test", speculates that the recovery of "gas cut oil and mud" was 50% oil and 50% water, and that a maximum rate of 20-25 BOPD might be produced by pumping, and thus reducing the bottom hole pressure to 100 psia.

AMENDED MARCH 21, 1983

INSTRUCTIONS

General: This form is designed for submitting a complete and correct well completion report and log on all types of lands and leases to either a Federal agency or a State agency, or both, pursuant to applicable Federal and/or State laws and regulations. Any necessary special instructions concerning the use of this form and the number of copies to be submitted, particularly with regard to local, area, or regional procedures and practices, either are shown below or will be issued by, or may be obtained from, the local Federal and/or State office. See instructions on items 22 and 24, and 33, below regarding separate reports for separate completions.

If not filed prior to the time this summary record is submitted, copies of all currently available logs (drillers, geologists, sample and core analysis, all types electric, etc.), formation and pressure tests, and directional surveys, should be attached hereto, to the extent required by applicable Federal and/or State laws and regulations. All attachments should be listed on this form, see item 35.

Item 4: If there are no applicable State requirements, locations on Federal or Indian land should be described in accordance with Federal requirements. Consult local State or Federal office for specific instructions.

Item 18: Indicate which elevation is used as reference (where not otherwise shown) for depth measurements given in other spaces on this form and in any attachments.

Items 22 and 24: If this well is completed for separate production from more than one interval zone (multiple completion), so state in item 22, and in item 24 show the producing interval, or intervals, top(s), bottom(s) and name(s) (if any) for only the interval reported in item 33. Submit a separate report (page) on this form, adequately identified, for each additional interval to be separately produced, showing the additional data pertinent to such interval.

Item 29: *"Sacks Cement":* Attached supplemental records for this well should show the details of any multiple stage cementing and the location of the cementing tool.

Item 33: Submit a separate completion report on this form for each interval to be separately produced. (See instruction for items 22 and 24 above.)

37. SUMMARY OF POROUS ZONES: SHOW ALL IMPORTANT ZONES OF POROSITY AND CONTENTS THEREOF; CORED INTERVALS; AND ALL DRILL-STEM TESTS, INCLUDING DEPTH INTERVAL TESTED, CUSHION USED, TIME TOOL OPEN, FLOWING AND SHUT-IN PRESSURES, AND RECOVERIES				38. GEOLOGIC MARKERS

Well Completion Report
National Petroleum Reserve in Alaska
South Barrow Well No. 20
Summary of Drill Stem Tests and Production Tests

Production Test No. 1	Upper & Lower Barrow sand	Perforations: 1994-2046' 2064-2082'	Could not unload calcium-chloride water; test aborted.
Production Test No. 2	Upper & Lower Barrow sand	Perforations: 1994-2046' 2064-2079'	Production Test: Perforated with 4 shots/ft. Well flowed at maximum rate of 1.3 MMCFGPD on 1.5" choke and FTP of 30 psi. Shut in well for 8 hours with maximum bottom hole SIP of 786 psi.
Production Test No. 3	"Pebble Shale" sands	Perforations: 1558-1574' 1629-1639'	Production Test: Perforated with 4 shots/ft. Opened well with no fluid to surface. Maximum surface tubing pressure 170 psi, declining to 0 psi. Unloaded well four (4) times in 24 hours with gas from Well No. 19. Recovered approximately 20 bbls. fluid consisting of gas-cut oil with mud. Bottom hole shut-in pressure: 192.5 psi.

AMENDED MARCH 21, 1983

Well Completion Report
National Petroleum Reserve in Alaska
South Barrow Well No. 20

SUMMARY OF CORED INTERVALS

CORE NO.	FORMATION	INTERVAL	CORE DESCRIPTION
1	Sag River	2247-2269' (Rec. 20')	Sandstone: very fine grained, argillaceous, grades to siltstone, fair to nil porosity, bleed heavy dark brown oil. Analysis indicates nil to fair permeability.
2	Sag River	2269-2299' (Rec. 29')	Sandstone: very fine grained, argillaceous, partly silty and glauconitic, poor to fair porosity, nil to fair permeability, bleed heavy residual oil from pores and fractures.
3	Sag River/ Argillite	2299-2314' (Rec. 15')	Sandstone: very fine to coarse grained, calcareous, argillaceous, poor to fair porosity, thin zones of fair to good permeability, generally bleeding very heavy residual dead oil from thin zones. Argillite (1.2') at base of core.

SUMMARY OF DRILL STEM TESTS AND PRODUCTION TESTS

DST No. 1	Triassic undifferentiated and Sag River	2127-2314'	Open Hole DST with packer set in shoe of 7" casing. No cushion above test tool. 1st FP (120 minutes): IHP 1163 psi, opened tool with strong blow decreasing to weak blow in 20 minutes on 1" choke, GTS in 60 minutes, 1st FP pressure 181 psi, shut in for 240 minutes, ISIP 909 psi. 2nd FP (480 minutes): Opened tool with strong blow on 1" choke, choked down to 1/16" with 15 psi FWHP after 5 hours. Changed to 1/8" choke with 19.5 psi FWHP, 2nd FP pressure 206-289 psi, shut in well for 900 minutes, FSIP 958 psi, (gauge set at 2139') recovered 2.6 barrels slightly gas-cut mud with trace of oil.

SOUTH BARROW No. 20 DRILL PAD

OPERATIONS HISTORY

DATE AND FOOTAGE DRILLED AS OF 6:00 A.M.	ACTIVITY
4/6/80	Raised derrick. Set 13-3/8" conductor at 100' and cemented with 230 sacks of Class "G" cement. Welded on 13-3/8" starter head; tested weld to 750 psi. Nippled up blowout preventer; continued with general rig up.
4/7/80	Finished nippling up blowout preventer; completed rig up. Tested Hydril and diverter to 250 psi. Prepared to spud.
4/8/80 1400'	Total Depth: 1500'; Mud Weight: 9; Viscosity: 37. Spudded well April 7, 1980, at 6:00 a.m. Drilled and surveyed to 1500'. Circulated and conditioned mud.
4/9/80 0'	TD: 1500'; MW: 9.1; Vis: 47. Circulated; surveyed. Made wiper trip; no fill. Circulated and conditioned mud; pulled out of hole. Ran DIL/SFL/GR/SP and BHCS/GR/TTI logs. Ran in hole; circulated and conditioned mud. Pulled out of hole. Ran 35 joints of 9-5/8", 53.5#, BTC, S-95 casing. Float shoe at 1490'; float collar; nine centralizers.
4/10/80 0'	TD: 1500'; MW: 9.1; Vis: 37. Cleared floor; ran Howco stab-in tool on drill pipe. Circulated and conditioned mud to cement. Pumped 20 barrels of water ahead of 1,300 sacks of Permafrost cement at 14.9 ppg. Returns at 14.8 ppg. Displaced with 9.5 barrels water. Cement in place March 9, 1980, at 12:30 p.m. Pulled out of hole; waited on cement; built $CaCl_2$ mud.
4/11/80 0'	TD: 1500'; MW: 10; Vis: 49. Waited on cement. Cut off 9-5/8" casing. Nippled down diverter system. Installed 9-5/8" weld-on flange. Tested weld to 1,000 psi. Nippled up blowout-preventer.
4/12/80 0'	TD: 1500'; MW: 10; Vis: 49. Nippled up blowout-preventer; tested. Repaired kelly cock; replaced Hydril element. Thawed out kelly. Tested blowout-preventer equipment.
4/13/80 270'	TD: 1770'; MW: 10.4; Vis: 58. Finished testing blowout-preventer equipment. Ran in hole; tagged float at 1443'. Tested casing to 1500 pounds. Drilled float and shoe; drilled to 1510'. Tested formation to 0.61 psi gradient; no leak off. Drilled ahead.

4/14/80 370'	TD: 2140'; MW: 10.8; Vis: 60. Drilled to 1830'; dropped survey. Pulled out of hole. Drilled to 2090'; circulated a gas show. Drilled to 2140'; circulated and conditioned mud. Dropped survey; pulled out of hole. Began logging.
4/15/80 0'	TD: 2140'; MW: 10.8; Vis: 58. Ran DLL/GR/SP/MSFL, BHCS/GR/TTI, and FDC/CNL/GR/CAL logs. Circulated and conditioned mud. Ran 7", 38# casing; landed at 2127'. Stabbed in and circulated. Lost-circulation in five minutes.
4/16/80 0'	TD: 2140'; MW: 10.7; Vis: 51. Picked up Halliburton unit and ran in hole to cement. Pumped a 25-barrel water spacer with 2% Cla-Sta and 80 sacks Class "G" cement with 2% $CaCl_2$ and 2% CFR-2 at 15.8 ppg; followed with two barrels water. Very slight returns during job. Cement in place April 15, 1980, at 7:30 a.m. Pulled out of hole. Ran in hole; shifted FO at 1297' and circulated annulus. Nippled down and set casing slips; installed packoff and tested to 3,000 psi. Nippled up blowout-preventer and tested.
4/17/80 0'	TD: 2140'; MW: 10.7; Vis: 51. Tested blowout-preventer equipment. Down squeezed 60 sacks Permafrost cement through lower FO. Waited on cement. Mixed Arctic pack; prewashed annulus through upper FO. Arctic pack became contaminated during prewash. Pumped Arctic pack in annulus as clean-out spacer. Began mixing new batch of Arctic pack.
4/18/80 21'	TD: 2161'; MW: 10; Vis: 38. Pumped contaminated Arctic pack around annulus; mixed and pumped second batch. Ran in hole, steel-line measuring. Tagged cement at 2085'. Circulated and conditioned mud. Drilled float, cement, and shoe to 2127'; cleaned out to 2140'; drilled to 2150'. Tested formation to 0.61 psi. Drilled ahead.
4/19/80 86'	TD: 2247'; MW: 9.9; Vis: 42. Drilled to 2162'; tripped for bit. Drilled to 2235'; tripped for bit. Drilled to 2247'; circulated samples. Pulled out of hole for core.
4/20/80 62'	TD: 2309'; MW: 9.9; Vis: 39. Picked up core barrel; ran in hole. Cut Core No. 1, 2247' to 2269'. Barrel jammed. Pulled out of hole; recovered 20.2 feet of core. Conditioned hole with bit. Cut Core No. 2, 2269' to 2299'. Barrel jammed. Pulled out of hole; recovered 29 feet of core. Conditioned hole with bit. Ran in hole with core barrel.

4/21/80
5'

TD: 2314'; MW: 9.9; Vis: 38. Cut Core No. 3, 2299' to 2314'. Pulled out of hole; recovered 14.9 feet of core. Picked up tools and ran in hole for Drill-Stem Test No. 1. Set packer at 2117' in 7" casing with no water cushion. Opened tool 4/20/80 at 12:10 p.m. for two-hour initial flow. Opened with strong blow, decreasing to weak blow in 20 minutes. Gas to surface in one hour. Shut well in for four hours. Opened for second flow period at 6:10 p.m. for eight-hour final flow. Opened with strong blow, stabilized on 1/8" choke at measured rate of 12 MCFPD at flow line. Flowing surface pressure: 17 psi. Downhole pressures, measured at 2139', were as follows: Initial hydrostatic: 1163 psi; first open period initial flow pressure: 88 psi; final flow pressure: 181 psi; initial shut-in pressure: 909 psi; second open period initial flow pressure: 206 psi; final flow pressure: 289 psi; final shut-in pressure: 958 psi; final hydrostatic pressure: 1163 psi. Well shut in for 15 hours.

4/22/80
40'

TD: 2354'; MW: 10.1; Vis: 38. Reversed out drill pipe. Recovered 2.6 barrels gas-cut mud. Pulled out of hole at 5:10 p.m. Laid down tools. Ran in hole; reamed core hole to 2314'. Drilled ahead.

4/23/80
2'

TD: 2356'; MW: 9.9; Vis: 33. Drilled to 2356'. Logging crew delayed due to weather. Made wiper trip to shoe. Ran in hole; circulated and conditioned mud. Pulled out of hole to log.

4/24/80

TD: 2356'; PBTD: 2025'; MW: 9.9; Vis: 33. Pulled out of hole for logs. Ran SP/GR/DLL. GR/CAL/CNL/FDC, GR/MLL, BHC/GR, and CBL/CCL. Ran in hole open-ended; set Plug No. 1 with 50 sacks Class "G" containing 2% $CaCl_2$ and 0.5% CFR-2 at 15.8 ppg (2343-2025'). Pulled out of hole to 2025'; reversed out. Waited on cement; cement in place at 12:15 a.m.

4/25/80

TD: 2356'; PBTD: 1930'; MW: 10.3; Vis: 35. Ran in hole; tagged cement at 2080'. Drilled to 2100'. Circulated and conditioned mud. Ran in hole with scraper. Ran in hole with retainer and set at 2095'. Tested to 2,000 pounds. Rigged up Schlumberger unit; perforated 1950-1951' with 4 shots/ft. Ran in hole with retainer and set at 1930'; tested to 2,000 pounds. Mixed and pumped ten barrels water with 2% Cla-Sta, followed with 60 sacks Class "G" cement at 15.8 ppg containing 2% $CaCl_2$ and 0.5% CFR-2. Displaced at 1.5 BPM at 500 pounds; built to 550 pounds. Final pressure: 300 pounds. Pulled out of hole to 1880'; reversed out. Cement in place April 25, 1980, at 4:00 a.m. Waited on cement.

4/26/80	PBTD: 2095'; MW: 10.3; Vis: 34. Waited on cement; tagged cement at 1907'. Drilled cement and retainer and cleaned out to 2095'. Circulated; tested perforations to 1,000 psi. Rigged up Schlumberger and tested lubricator to 500 psi. Ran in hole with perforating guns.
4/27/80	PBTD: 2095'. Perforated at four shots per foot for Production Test No. 1 of the Barrow sandstones, 1994' to 2046' and 2064' to 2082'. Ran 69 joints of 2-7/8", N-80, 6.5# EUE tubing. Landed tubing at 2083'. Nippled down blowout-preventer.
4/28/80	PBTD: 2095'. Nippled down blowout-preventer; nippled up tree and tested to 3,000 psi. Displaced well to 9.2 ppg $CaCl_2$ water. Attempted to rock well in with nitrogen but could not establish a reliable flow, so test was aborted.
4/29/80	PBTD: 2095'. Cleaned up well.
4/30/80	PBTD: 2095'. Cleaned well and killed flow. Installed back pressure valve; nippled down production tree. Nippled up box. Tested blowout preventer, choke, and Hydril. Pulled out of hole with tubing. Rigged up Schlumberger; ran in hole with perforating guns.
5/1/80	PBTD: 2095'. Reperforated at four shots per foot for Production Test No. 2 of the Barrow Sandstones, 1994' to 2046' and 2064' to 2079', Ran tubing. Nippled down blowout preventers; nippled up tree. Laid gas line from Barrow Well 19 to Barrow Well 20. Pumped seven barrels MC acid down tubing and squeezed away at 1/4 BPM. Unloaded well, 800 pounds on annulus and 600 pounds on tubing.
5/2/80	PBTD: 2095'. Cleaned up well. Shut well in at 11:30 p.m. with 1.315 MMCPD at 19 psi flowing pressure on 1-1/2" choke. Ran in hole with Hewlett Packard recorder. Initial BHT: 34.7°. BHT at 6:00 p.m.: 37.2°. BHP at 6:00 p.m.: 734 psi. Surface pressure: 625 psi.
5/3/80	PBTD: 2095'. Completed build up. Final BHP: 765 psi. BHT: 37.2°F. Killed well. Nippled up blowout preventers. Pulled out of hole with tubing. Ran in hole with RTTS. Tested perforations to 1,000 psi. Spotted Halliburton FEA. Set packer at 2056'. Pumped 48 barrels FEA, 1/3 BPM at 350 psi and 2 BPM at 450 psi. Shut in 30 minutes. Bled back; killed well with calcium-chloride water. Pulled out of hole with tubing.

5/4/80 PBTD: 2095'. Finished pulling out of hole with RTTS. Ran in hole with tubing. Nippled down blowout-preventer; nippled up tree. Tested to 3,000 psi. Unloaded well. Tubing became plugged. Injected alcohol; thawed tubing. Flowed well at 1.3 MMCF, 30 psi, with 1 BPM, 8.8 ppg water.

5/5/80 PBTD: 2095'. Flowed well; no choke. Casing: 130 psi; tubing: 30 psi. Well unloaded approximately 1 BPM water at 8.8 ppg. Shut in well for two hours. Began four-point flow test on 1/16" choke. Initial casing pressure: 550 psi; tubing pressure: 450 psi. Shut well in at 6:00 p.m. Ran Hewlett Packard recorder to bottom. Opened at 8:30 p.m. to clear liquids. Initial pressure: 690 psi; after blowing out liquids: 519 psi. Pressure at 4:30 a.m.: 786 psi.

5/6/80 PBTD: 2095'. Finished buildup; killed well. Nippled down tree and nippled up blowout-preventer. Tested to 3,000 psi. Pulled out of hole with tubing. Ran in hole with drill pipe and scraper to 1903'. Circulated and pulled out of hole.

5/7/80 PBTD: 1749'. Circulated; pulled out of hole with scraper. Ran in hole and set retainer at 1904'. Mixed and pumped ten barrels water and 100 sacks Class "G" with 2% $CaCl_2$ and 1% CFR-2 at 15.8 ppg. Squeezed and reversed out drill pipe. Pulled out of hole. Perforated at 1780'. Ran in hole and set retainer at 1749'. Mixed and pumped 20 sacks Permafrost cement at 14.8 ppg. Squeeze pressure: 1,000 psi. Reversed out and conditioned. Pulled out of hole. Cement in place May 6, 1980, at 5:00 p.m. Pulled out of hole. Ran in hole with tubing. Laid down 12 joints. Perforated from 1629' to 1639' and from 1556' to 1574' of the "Pebble Shale" sandstones for Production Test No. 3. Ran in hole with drill pipe. Circulated and conditioned mud to 9.6 (160 psi when perforated). Pulled out of hole; changed rams. Ran tubing with accessories.

5/8/80 PBTD: 1749'. Ran 55 joints of 2-7/8" tubing; landed at 1644'. Installed tree. Waited on cement. Unloaded well; flowed well. Rigged-up and ran Hewlett Packard recorder and temperature tool. Well depleted on flow test. BHT: 39.3°F, 270 psi. Final flow: 60 psi. Build up after five hours and twenty minutes: 382 psi.

5/9/80 PBTD: 1749'. Tested with Hewlett Packard and temperature recorders in well. Built-up for eight

hours. Opened on 1/16" choke; well died. Lifted out liquids with Well No. 19. Recovered an estimated 21 barrels of gas-cut oil and mud. Flowed on 1/8" choke; well died faster. Opened to test tank. BHP: 110 psi; built to 192.5 psi at termination. Pulled out of hole with wireline. Killed well. Nippled down Christmas tree and nippled up blowout-preventer.

5/10/80

PBTD: 1749'. Nippled up blowout-preventer and tested. Nippled up Christmas tree and tested to 3,000 psi. Unloaded $CaCl_2$ from well. Shut well in.

Removed all test lines. Laid down drill pipe, drill collars, and kelly. Released rig May 10, 1980, at 6:00 a.m. Cleaned pits. Began rigging down.

DIVISION OF SMITH INTERNATIONAL INC

INTRODUCTION

After the 1976 drilling season, casing requirements were reviewed and design of casing strings standardized. Every effort was made to minimize weight and grade changes for simplicity, cost effectiveness, and to reduce chances of error during handling and running operations. Casing sizes were selected to accommodate designs for wells from 2,000' to 20,000'. Steel grade selection was the controlling factor on design with low hardness (Rockwell C24-28) steel being selected for Arctic application and possible H_2S environment. Below is listed casing sizes and design criteria required by Husky:

		YIELD STRENGTH (PSI)		MINIMUM PRESSURE REQUIREMENT (PSI)		
SIZE[1]	WEIGHT	MIN.	MAX.	COLLAPSE	BURST	CONNECTION
20"	133#/ft.	55,000	80,000	1,500	3,050	STC
13-3/8"[2]	72#/ft.	95,000	110,000	3,450	5,350	BTC
9-5/8"[3]	53.5#/ft.	95,000	110,000	8,850	7,900	BTC
9-3/4"[3]	59.2#/ft.	95,000	110,000	9,750	8,540	BTC
7"	38#/ft.	95,000	110,000	12,600	9,200	BTC

(1) OD tolerance to be within API requirements unless adjustment absolutely necessary to meet ID requirements.

(2) Special drift to 12.25".

(3) Special drift to 8.50".

The following are additional requirements primarily to assure that the steel exhibits the metallurgical properties for Arctic applications and resistance to hydrogen embrittlement.

1. All pipe that is 13-3/8" OD and smaller to be quenched and tempered.

2. Run Charpy "V" notch tests on two random samples per 50 tons per heat. Minimum acceptance of 15 ft.-lb.@-50°F. Furnish test reports with order.

3. Perform all testing normally required for API approved pipe.

4. Furnish test reports for ladle analysis, quantitative analysis, and all check tests as per API requirements.

In addition, the following handling requirements were made:

1. Collars must be of same steel grade as pipe body.

2. Apply an API modified thread compound on mill-installed collar before bucking on.

3. Inspect at mill using Tuboscope's Amalog IV or equivalent on 9-3/4" and smaller, and at least magnetic particle on 13-3/8" and 20". All pipe to have special and area inspection together with full length API drifting. (Note special drifting requirements.)

4. Apply Arctic grade grease on all connections before installing thread protectors.

5. Install closed-end type thread protectors. Plastic plugs can be used to secure wrench openings in protectors.

6. Buck up thread protectors with impact wrench. Both mill and third party inspection personnel should observe the installation of thread protectors.

7. Palletize or containerize the tubulars, if possible, prior to shipment from mill. Do not haul pipe like cordwood in gondola railroad cars.

8. All pipe to be Range 3.

9. No "V" notching or metal stenciling on pipe body or collars.

Casing for South Barrow Well No. 20 was programmed as follows: 13-3/8" conductor at ±110'; 9-5/8" at ±1500'; 7" at ±2100'; 2-7/8" production tubing to the top of the producing zone should the well be completed.

Temperatures in the reservoirs in the East Barrow gas field range from 50-55°F due to permafrost depth. Because of this, production completions have been modified to prevent downhole freeze-off of the wells due to hydrate formation. Husky's usual procedure has been to suspend a 2-7/8" string of production tubing in the 7" casing to the top of the producing zone. The well is then produced through the 7" x 2-7/8" annulus. The lesser pressure drop in the larger annulus helps to prevent the formation of hydrates downhole. The 2-7/8" tubing is then used to inject alcohol (blown down the well) when freeze-off does occur. In South Barrow No. 20, a string of 2-7/8" production tubing was run to 1644' (just below the bottom perforations at 1639') when the well was completed in the "Pebble Shale" sands.

Casing actually run in the well was 13-3/8" at 100'; 9-5/8" at 1490', and 7" at 2127'.

WELLHEAD DRAWING

ARCTIC CASING PACK

In production wells, wells suspended through summer months, and wells completed for re-entry with temperature recording tools, Baroid Arctic Casing Pack was used between casing strings. It is a stable, highly viscous fluid which will not freeze and collapse casing set in permafrost zones. Its unique gelling characteristics exhibit excellent thermal properties (heat transfer coefficient of approximately 0.1 BTU per hour per square feet per degree F at 32°F). Composition of Baroid Arctic Casing Pack used is as follows for each 100 barrels mixed:

Diesel	82.0 barrels
Water	5.0 barrels
Salt	60.0 ppb per barrel of water
EZ Mul	12.5 ppb
Gel Tone	50.0 ppb
Barite	103.0 ppb

The 9-5/8" x 7" annulus in South Barrow No. 20 was left full of Arctic Pack from 1297' to the surface when the well was completed. The annulus was displaced with Arctic Pack through the FO at 1217' immediately after the 7" casing was run in anticipation of completing the well as a gas producer in the Barrow sandstones. When the decision was made to squeeze the Barrow sandstones and complete in the "Pebble Shale" sands, the Arctic Pack was left in place.

RIG INVENTORY

Draw Works

National T-20, single drum grooved for 1" wireline with 15" double hydromatic brake, automatic breakout and make up catheads, driven by one set GMC diesel twin 671 engines, 300 HP, through Allison torque converter, all mounted on single skid. One Westinghouse 3YC air compressor driven by main PTO.

Mast

Lee C. Moore, 95' high with 9 foot wide front by spread cantilever. Gross nominal capacity 290,000 lbs. with racking board capacity of 130 stands 4-1/2" drill pipe (doubles). Mast crown block capable of stringing eight 1" wire lines.

Subbase

Three box sections, two at ground level 8 feet high, 9 feet wide, 37 feet long; center section 8 feet 5 inches high, 9 feet wide and 37 feet long. Clear working space from bottom of rotary beam to bottom of subbase is 14 feet 7 inches. Rotary table to bottom of subbase is 17 feet (add four inches for rig matts).

Rig Matts

Ten 4" x 16' long x 8' wide; fifteen 4" x 24' long x 8' wide.

Traveling Blocks

IDECO, 160 ton, four 1" sheave combination block and hook.

Swivel

EMSCO L-140, 6-5/8" left hand API regular pin, 140 ton capacity.

Bails

Byron Jackson, 2-1/4" x 108', links 250 ton capacity.

Rotary Table

Oilwell 17-1/2" split square drive master bushing, 275 ton static load capacity.

Mud Tank

Three section, insulated tank. Capacity shale tank: 75 barrels; capacity middle tank: 100 barrels; capacity suction tank: 112 barrels. Shale tank equipped with shale jet and 16 barrel trip tank. Total capacity: 303 barrels.

Shaker

Single Brandt tandem separator driven by 3 HP, three-phase, 440 volt, 1750 RPM explosion proof electric motor.

Degasser

Drilco, see-flo, driven by 7-1/2 HP, three-phase, 440 volt, explosion proof motor with 1/2 HP, three-phase, 440 volt explosion proof blower.

Desander

Pioneer Model S2-12; capacity: 500 GPM.

Desilter

Pioneer Model T8-6; capacity: 500 GPM.

Mud Mixer

One Dreco, driven by 5 HP, three-phase, 440 volt, 1725 RPM explosion proof motor.

Hopper

One low pressure mud mixing hopper.

Generators

One Caterpillar Model 3406, 210 KW; one Caterpillar, skid mounted in Hercable house, 8' 5" high x 8' 2" wide x 29' 5" long; one Caterpillar Model D-333, 100 KW standby.

Boilers

Two Continental, 40 HP, 120 PSI diesel fired skid mounted in Hercable house, 8' 4" high x 8' wide x 35' long.

Steam Heaters

Seven Model 90H Trane steam heaters; three Model 96H Trane steam heaters.

Tongs

Byron Jackson, Type "C", short lever, with heads.

Indicator

(Weight) Cameron, Type "C", up to 400,000 lbs.

Indicator

(Rotary Torque) Martin Decker hydraulic piston wheel type with remote gauge at Driller's position.

Indicator

(Tong Torque) Martin Decker hydraulic piston type with remote gauge.

Mud Box

OKE mud box with 3-1/2" and 4-1/2" rubbers.

Slips

One set for 3-1/2" drill pipe. One set for 4-1/2" drill pipe.

Elevators

One set for 3-1/2" drill pipe, 18 degrees taper. One set for 4-1/2" drill pipe, 18 degrees taper.

Kelly

One square 4-1/4" drive, 4" FH pin, 6-5/8" API regular left hand box. One square 3-1/2" drive, 3-1/2" IF pin, 6-5/8" API regular left hand box.

Kelly Bushing

VARCO, square drive, 3-1/2" rollers.

Pumps

(Drilling and Cementing) Two Halliburton, HT-400D, single acting piston pumps with Gist Oil Tool API fluid ends, each driven by GMC diesel 8V-71N, 300 HP engines through an Allis-Chalmers torque converter, Model 8FW180I-I and a twin-disc power shift transmission, Model no. T-A-51-2003. Continuous duty with 5-1/2" API pistons at maximum of 75 SPM will produce 185 GPM for each pump with maximum pressure up to 3000 psi. Both pumps can be run simultaneously if desired. The discharge mud line furnished by contractor from pumps to swivel connection is designed for 3000 psi working pressure. Each pump unit mounted on 8' 4" high x 10' wide x 40' long covered skid.

Air Compressors

One LeRoi 34C mounted on draw works compound. One Ingersoll Rand Model 71-T2-T3011 TM, driven by 10 HP, 440 volt, 1725 RPM explosion proof electric motor.

Water Tanks
